

## Post-Science Reincarnation

### When Life Becomes Permanent, The World Will Be Different.

The technical term for reincarnation in post-science is cloning. Nature is not as interested in the temporary life as in the permanent DNA, which the life is expressing. The purpose of the death of the temporary life is to erase the timely knowledge, which the life has absorbed, especially, the obsolete part. The new life from cloning can start anew in knowledge absorption for the new physical body. The continuation of the old life to the new life can be achieved by the recording of the old life for the new life. In addition to have a complete record of one's DNA for cloning, everyone should write an autobiography in order for the spirit of the old life to be continued in the new life.

Knowledge can be separated into structural and descriptive knowledge. For example, how a person looks externally and internally is descriptive knowledge, and how the organs function is structural knowledge. And, as an existing knowledge, the design of computer chip uses two computer languages: Structural Programming Language and Descriptive Programming Language, as demonstrated in Verilog. The Western scientific culture emphasizes structural knowledge, based mainly in analytic ability. To think, one needs to employ all the mental faculties, which include primarily, in addition to the analytic ability, perception and creativity. The Eastern culture has traditionally occupied by perception, which is more efficient than analysis in dealing with social interactions. Perception is the main tool for descriptive knowledge.

Post-science is the continuation of science and is also based mainly on the analytic ability. Fuzzy logic attempts to analyze the fuzzy exterior of reality and is the analytic approach to descriptive knowledge. The real home of the descriptive knowledge is the Eastern culture. The following is a description of cloning from the Eastern culture.

The definition of reincarnation from the Knowledge Book, which is based on the cosmic message to V. Bulent Corak, is To be Born Anew; To be embodied again and again. Additionally, a letter from the Center to Our Friends on Earth on Reincarnation on Page 216:

“Meanwhile the existence or non-existence of Reincarnation is still the subject of argument.”...

“Time will pass, each will claim his/her Essence Consciousnesses and, one day, the entire Truth will Shine with all clarity.”

“In future Gene Transfers will be mentioned clearly and in detail. Our love is upon the entire Universe.”

Clearly, the contributions from both the structural and descriptive knowledge merge for reincarnation. In May of 2013, , Shoukhrat Mitalipov led a team at the Oregon Health and Science University have developed the embryo to the blastocyst stage - around 150 cells - which is enough to provide a source of embryonic stem cells. Post-science has discovered DNA theoretically by the invention of the self-generating and completely automated Universal Permanent Software.
